

Node Builder

Node Builder – Build your own integration objects to any destination

Node Builder provides an easy to use interface that makes creating custom integration objects as simple as using SmartList Builder. Node Builder from eOne takes the development out of building custom nodes for eConnect and custom stored procedures. If you need to create data or integrate into Microsoft Dynamics GP or any other SQL table for which there is no existing eConnect node, then Node Builder fills the gap.

Node Builder lets you build custom eConnect nodes with complex validation and error handling without writing a single line of code. GP consultants and technical users can now build pathways from any data source to any data destination.

Node Builder makes SmartConnect an indispensable tool for Dynamics GP. The user-friendly interface allows you to easily import data into literally any part of GP. By utilizing Node Builder, there is no more searching for the perfect data conversion tool! eOne has already made it!!!

New Nodes

Build an eConnect node for any table or combination of tables. You choose the tables and the fields you need to update and Node Builder creates the eConnect objects. Build nodes for all third party and add-on products for GP.

New Stored Procedures

Node Builder is not limited to just GP. Point Node Builder at any set of tables to create stored procedures that allow SmartConnect to write to any destination of your choice.

Build in Validation

Build validation rules into your custom integration objects with easy to use wizards. Ensure that bad data cannot be imported via your custom node by defining a simple or complex set of integration rules. Selecting the data columns that must be validated before the import can proceed.

Automatic Integration with SmartConnect

When you have finished creating your custom integration object, publish them to SmartConnect directly. This means your new object will be listed in SmartConnect like every out of the box eConnect object and all the functionality of SmartConnect can be applied immediately.

Write your Own Error Codes

Add your own error messages to your custom object. Make sure you let end users know exactly why the integration failed by giving them clear and precise messages.

Publish to Multiple Companies

With the click of a button the new eConnect Node can be added to any GP company you want.
